INTRODUCTION

- PedLagao is a tech-driven platform designed to connect tree sponsors with verified planters, making the process of tree plantation transparent, efficient, and impactful.
- Built using the MERN stack with MySQL, the platform allows users to sponsor trees based on location, type, and quantity.
- Planters accept tasks, plant trees, and upload photographic proof. All activities are reflected in a real-time public feed, ensuring authenticity and engagement.
- PedLagao aims to promote environmental sustainability by making tree planting accessible to all—individuals, organizations, and communities—empowering them to take action for a greener, healthier planet, one tree at a time.

PROBLEM STATEMENT

- Climate change and deforestation are major global issues.
- Lack of a dedicated platform to promote and track individual plantation activities.
- Low public participation and awareness in environmental activities.
- No centralized system to manage and monitor tree plantation efforts.

FEATURE OVERVIEW

- User Registration and Authentication
- Plantation request System
- Post Creation and Social Feed
- Likes and Comments
- Media Handling and Storage

USER FLOW DIAGRAM

TECHNOLOGY USED

Frontend:

- **React.js** – Core library for building the user interface.
- **React-Bootstrap** – For responsive and styled UI components.
- **Axios** – Used for making HTTP requests to the backend.
- **React Context API** – Manages global authentication state (user, token).

TECHNOLOGY USED

Backend:

- **Node.js:** A runtime that lets you run JavaScript on the server side.
- **Express.js:** A lightweight framework built on Node.js to create APIs and handle HTTP requests efficiently.
- **Multer** – Middleware for handling file uploads (images, videos).
- **bcrypt** – Used for hashing passwords securely.

Database:

- **MySQL:** An open-source relational database management system used to store and manage structured data using SQL (Structured Query Language).

Other Tools:

- **Postman:** A tool for testing APIs by sending requests and viewing responses.
- **Visual Studio Code (VS Code):** A powerful code editor used for developing and debugging projects.

CONCLUSION

- Promotes Environmental Awareness through digital tools.
- Encourages active community engagement in green initiatives.
- Tracks plantation efforts to ensure transparency and credibility.
- Supports collaboration through social interactions and media sharing.

FUTURE SCOPE

- Add different user roles like Admin, Volunteer, and Sponsor. Admins can approve posts or plantation requests. Volunteers can fulfill specific request types.
- Introduce a points system for every post, plantation request, or fulfillment. Badges and leaderboards to encourage active participation. Redeemable points for eco-friendly products or donations.
- Integrate Google Maps or Mapbox to tag plantation locations. Users can view nearby plantation requests or completed plantations.

THANK YOU
